

Pretreated Healing Progression in Crushing Fall **86-Year-Old Patient — No break/fracture/concussion** **(No pain meds required after hospital discharge)**

January 13
Initial trauma from fall.

January 23
10 days after fall.

January 30
17 days after fall.

February 7
24 days after fall.

February 13
31 days after fall.

February 21
39 days after fall.

February 28
46 days after fall.

March 8
54 days after fall.

Case Study

This case study is a review of a serious fall whereby an 86-year-old woman sustained significant trauma to her face. The attending emergency room physician initially told her that recovery would take 4-6 months. Instead, she demonstrated remarkable healing and lack of serious injury (**no broken or fractured nose**), with the only reasonable explanation being that she had pre-treated with PSK003 Precursor for 8 months prior to the fall. Because these lipids are the “brick and mortar” of tissue, her healing has been accelerated, and she required no pain meds after release from the hospital. The accompanying photographs graphically show her recuperation.
